

Probabilistic Logic Languages

Fabrizio Riguzzi

Outline

- 1 Probabilistic Logic Languages
- 2 Distribution Semantics
- 3 Expressive Power
- 4 Conversion to Bayesian Networks
- 5 Distribution Semantics with Function Symbols
- 6 Knowledge-Based Model Construction

Combining Logic and Probability

- Useful to model domains with complex and uncertain relationships among entities
- Many approaches proposed in the areas of Logic Programming, Uncertainty in AI, Machine Learning, Databases
- Logic Programming: Distribution Semantics [Sato, 1995]
- A probabilistic logic program defines a probability distribution over normal logic programs (called **instances** or **possible worlds** or simply **worlds**)
- The distribution is extended to a joint distribution over worlds and queries
- The probability of a query is obtained from this distribution

Probabilistic Logic Programming (PLP) Languages under the Distribution Semantics

- Probabilistic Logic Programs [Dantsin, 1991]
- Probabilistic Horn Abduction [Poole, 1993], Independent Choice Logic (ICL) [Poole, 1997]
- PRISM [Sato, 1995]
- Logic Programs with Annotated Disjunctions (LPADs) [Vennekens et al., 2004]
- ProbLog [De Raedt et al., 2007]
- They differ in the way they define the distribution over logic programs

Independent Choice Logic

$sneezing(X) \leftarrow flu(X), flu_sneezing(X).$
 $sneezing(X) \leftarrow hay_fever(X), hay_fever_sneezing(X).$
 $flu(bob).$
 $hay_fever(bob).$

$disjoint([flu_sneezing(X) : 0.7, null : 0.3]).$
 $disjoint([hay_fever_sneezing(X) : 0.8, null : 0.2]).$

- Distributions over facts by means of **disjoint** statements
- *null* does not appear in the body of any rule
- Worlds obtained by selecting one atom from every grounding of each disjoint statement

Independent Choice Logic

- 4 worlds

$sneezing(X) \leftarrow flu(X), flu_sneezing(X).$

$sneezing(X) \leftarrow hay_fever(X), hay_fever_sneezing(X).$

$flu(bob).$

$hay_fever(bob).$

$flu_sneezing(bob).$

$null.$

$hay_fever_sneezing(bob).$

$hay_fever_sneezing(bob).$

$P(w_1) = 0.7 \times 0.8$

$P(w_2) = 0.3 \times 0.8$

$flu_sneezing(bob).$

$null.$

$null.$

$null.$

$P(w_3) = 0.7 \times 0.2$

$P(w_4) = 0.3 \times 0.2$

- $sneezing(bob)$ is true in 3 worlds

- $P(sneezing(bob)) = 0.7 \times 0.8 + 0.3 \times 0.8 + 0.7 \times 0.2 = 0.94$

PRISM

```

sneezing(X)  $\leftarrow$  flu(X), msw(flu_sneezing(X), 1).
sneezing(X)  $\leftarrow$  hay_fever(X), msw(hay_fever_sneezing(X), 1).
flu(bob).
hay_fever(bob).

```

```

values(flu_sneezing(_X), [1, 0]).
values(hay_fever_sneezing(_X), [1, 0]).
: -set_sw(flu_sneezing(_X), [0.7, 0.3]).
: -set_sw(hay_fever_sneezing(_X), [0.8, 0.2]).

```

- Distributions over *msw* facts (random switches)
- Worlds obtained by selecting one value for every grounding of each *msw* statement

Logic Programs with Annotated Disjunctions

$sneezing(X) : 0.7 \vee null : 0.3 \leftarrow flu(X).$
 $sneezing(X) : 0.8 \vee null : 0.2 \leftarrow hay_fever(X).$
 $flu(bob).$
 $hay_fever(bob).$

- Distributions over the head of rules
- *null* does not appear in the body of any rule
- Worlds obtained by selecting one atom from the head of every grounding of each clause

ProbLog

$sneezing(X) \leftarrow flu(X), flu_sneezing(X).$
 $sneezing(X) \leftarrow hay_fever(X), hay_fever_sneezing(X).$
 $flu(bob).$
 $hay_fever(bob).$
 $0.7 :: flu_sneezing(X).$
 $0.8 :: hay_fever_sneezing(X).$

- Distributions over facts
- Worlds obtained by selecting or not every grounding of each probabilistic fact

Distribution Semantics

- Case of no function symbols: finite Herbrand universe, finite set of groundings of each disjoint statement/switch/clause
- **Atomic choice**: selection of the i -th atom for grounding $C\theta$ of disjoint statement/switch/clause C
 - represented with the triple (C, θ, i)
 - a ProbLog fact $p :: F$ is interpreted as $F : p \vee \text{null} : 1 - p$.
- Example $C_1 = \text{disjoint}([flu_sneezing(X) : 0.7, \text{null} : 0.3])$,
 $(C_1, \{X/bob\}, 1)$
- **Composite choice** κ : consistent set of atomic choices
- $\kappa = \{(C_1, \{X/bob\}, 1), (C_1, \{X/bob\}, 2)\}$ not consistent
- The probability of composite choice κ is

$$P(\kappa) = \prod_{(C, \theta, i) \in \kappa} P_0(C, i)$$

Distribution Semantics

- **Selection** σ : a total composite choice (one atomic choice for every grounding of each disjoint statement/clause)
- $\sigma = \{(C_1, \{X/bob\}, 1), (C_2, \{X/bob\}, 1)\}$

$C_1 = \text{disjoint}([flu_sneezing(X) : 0.7, null : 0.3]).$

$C_2 = \text{disjoint}([hay_fever_sneezing(X) : 0.8, null : 0.2]).$

- A selection σ identifies a logic program w_σ called **world**
- The probability of w_σ is $P(w_\sigma) = P(\sigma) = \prod_{(C, \theta, i) \in \sigma} P_0(C, i)$
- Finite set of worlds: $W_T = \{w_1, \dots, w_m\}$
- $P(w)$ distribution over worlds: $\sum_{w \in W_T} P(w) = 1$

Distribution Semantics

- Herbrand base $H_T = \{A_1, \dots, A_n\}$
- $P(a_j|w) = 1$ if A_j is true in w and 0 otherwise
- $P(a_j) = \sum_w P(a_j, w) = \sum_w P(a_j|w)P(w) = \sum_{w \models A_j} P(w)$

Example Program (ICL)

- 4 worlds

$sneezing(X) \leftarrow flu(X), flu_sneezing(X).$

$sneezing(X) \leftarrow hay_fever(X), hay_fever_sneezing(X).$

$flu(bob).$

$hay_fever(bob).$

$flu_sneezing(bob).$

$null.$

$hay_fever_sneezing(bob).$

$hay_fever_sneezing(bob).$

$P(w_1) = 0.7 \times 0.8$

$P(w_2) = 0.3 \times 0.8$

$flu_sneezing(bob).$

$null.$

$null.$

$null.$

$P(w_3) = 0.7 \times 0.2$

$P(w_4) = 0.3 \times 0.2$

- $sneezing(bob)$ is true in 3 worlds

- $P(sneezing(bob)) = 0.7 \times 0.8 + 0.3 \times 0.8 + 0.7 \times 0.2 = 0.94$

Example Program (LPAD)

- 4 worlds

sneezing(bob) \leftarrow *flu(bob)*.

sneezing(bob) \leftarrow *hay_fever(bob)*.

flu(bob).

hay_fever(bob).

$P(w_1) = 0.7 \times 0.8$

null \leftarrow *flu(bob)*.

sneezing(bob) \leftarrow *hay_fever(bob)*.

flu(bob).

hay_fever(bob).

$P(w_2) = 0.3 \times 0.8$

sneezing(bob) \leftarrow *flu(bob)*.

null \leftarrow *hay_fever(bob)*.

flu(bob).

hay_fever(bob).

$P(w_3) = 0.7 \times 0.2$

null \leftarrow *flu(bob)*.

null \leftarrow *hay_fever(bob)*.

flu(bob).

hay_fever(bob).

$P(w_4) = 0.3 \times 0.2$

- sneezing(bob)* is true in 3 worlds
- $P(\textit{sneezing}(\textit{bob})) = 0.7 \times 0.8 + 0.3 \times 0.8 + 0.7 \times 0.2 = 0.94$

Example Program (ProbLog)

- 4 worlds

$sneezing(X) \leftarrow flu(X), flu_sneezing(X).$

$sneezing(X) \leftarrow hay_fever(X), hay_fever_sneezing(X).$

$flu(bob).$

$hay_fever(bob).$

$flu_sneezing(bob).$

$hay_fever_sneezing(bob).$ $hay_fever_sneezing(bob).$

$P(w_1) = 0.7 \times 0.8$

$P(w_2) = 0.3 \times 0.8$

$flu_sneezing(bob).$

$P(w_3) = 0.7 \times 0.2$

$P(w_4) = 0.3 \times 0.2$

- $sneezing(bob)$ is true in 3 worlds

- $P(sneezing(bob)) = 0.7 \times 0.8 + 0.3 \times 0.8 + 0.7 \times 0.2 = 0.94$

Examples

Throwing coins

```
heads(Coin):1/2 ; tails(Coin):1/2 :-  
    toss(Coin), \+biased(Coin).  
heads(Coin):0.6 ; tails(Coin):0.4 :-  
    toss(Coin), biased(Coin).  
fair(Coin):0.9 ; biased(Coin):0.1.  
toss(coin).
```

Russian roulette with two guns

```
death:1/6 :- pull_trigger(left_gun).  
death:1/6 :- pull_trigger(right_gun).  
pull_trigger(left_gun).  
pull_trigger(right_gun).
```

Examples

Mendel's inheritance rules for pea plants

```

color(X, purple) :- cg(X, _A, p) .
color(X, white) :- cg(X, 1, w) , cg(X, 2, w) .
cg(X, 1, A) : 0.5 ; cg(X, 1, B) : 0.5 :-
    mother(Y, X) , cg(Y, 1, A) , cg(Y, 2, B) .
cg(X, 2, A) : 0.5 ; cg(X, 2, B) : 0.5 :-
    father(Y, X) , cg(Y, 1, A) , cg(Y, 2, B) .

```

Probability of paths

```

path(X, X) .
path(X, Y) :- path(X, Z) , edge(Z, Y) .
edge(a, b) : 0.3 .
edge(b, c) : 0.2 .
edge(a, c) : 0.6 .

```

Encoding Bayesian Networks

burg	t	f
	0.1	0.9

earthq	t	f
	0.2	0.8

alarm	t	f
b=t,e=t	1.0	0.0
b=t,e=f	0.8	0.2
b=f,e=t	0.8	0.2
b=f,e=f	0.1	0.9

`burg(t):0.1 ; burg(f):0.9.`

`earthq(t):0.2 ; earthqu(f):0.8.`

`alarm(t):-burg(t),earthq(t).`

`alarm(t):0.8 ; alarm(f):0.2:-burg(t),earthq(f).`

`alarm(t):0.8 ; alarm(f):0.2:-burg(f),earthq(t).`

`alarm(t):0.1 ; alarm(f):0.9:-burg(f),earthq(f).`

Expressive Power

- All these languages have the same expressive power
- LPADs have the most general syntax
- There are transformations that can convert each one into the others
- ICL, PRISM: direct mapping
- ICL, PRISM to LPAD: direct mapping

LPADs to ICL

- Clause C_i with variables \overline{X}

$$H_1 : p_1 \vee \dots \vee H_n : p_n \leftarrow B.$$

is translated into

$$H_1 \leftarrow B, \text{choice}_{i,1}(\overline{X}).$$

$$\vdots$$

$$H_n \leftarrow B, \text{choice}_{i,n}(\overline{X}).$$

$$\text{disjoint}([\text{choice}_{i,1}(\overline{X}) : p_1, \dots, \text{choice}_{i,n}(\overline{X}) : p_n]).$$

LPADs to ProbLog

- Clause C_i with variables \bar{X}

$$H_1 : p_1 \vee \dots \vee H_n : p_n \leftarrow B.$$

is translated into

$$H_1 \leftarrow B, f_{i,1}(\bar{X}).$$

$$H_2 \leftarrow B, \text{not}(f_{i,1}(\bar{X})), f_{i,2}(\bar{X}).$$

$$\vdots$$

$$H_n \leftarrow B, \text{not}(f_{i,1}(\bar{X})), \dots, \text{not}(f_{i,n-1}(\bar{X})).$$

$$\pi_1 :: f_{i,1}(\bar{X}).$$

$$\vdots$$

$$\pi_{n-1} :: f_{i,n-1}(\bar{X}).$$

where $\pi_1 = p_1$, $\pi_2 = \frac{p_2}{1-\pi_1}$, $\pi_3 = \frac{p_3}{(1-\pi_1)(1-\pi_2)}$, \dots

- In general $\pi_i = \frac{p_i}{\prod_{j=1}^{i-1} (1-\pi_j)}$

Conversion to Bayesian Networks

- PLP can be converted to Bayesian networks
- Conversion for an LPAD T
- For each atom A in H_T a binary variable A
- For each clause C_i in the grounding of T

$$H_1 : p_1 \vee \dots \vee H_n : p_n \leftarrow B_1, \dots, B_m, \neg C_1, \dots, \neg C_l$$

a variable CH_i with $B_1, \dots, B_m, C_1, \dots, C_l$ as parents and H_1, \dots, H_n and *null* as values

- The CPT of CH_i is

	...	$B_1 = 1, \dots, B_m = 1, C_1 = 0, \dots, C_l = 0$...
$CH_i = H_1$	0.0	p_1	0.0
...			
$CH_i = H_n$	0.0	p_n	0.0
$CH_i = \text{null}$	1.0	$1 - \sum_{i=1}^n p_i$	1.0

Conversion to Bayesian Networks

- Each variable A corresponding to atom A has as parents all the variables CH_i of clauses C_i that have A in the head.
- The CPT for A is:

	at least one parent equal to A	remaining columns
$A = 1$	1.0	0.0
$A = 0$	0.0	1.0

Conversion to Bayesian Networks

$$\begin{aligned}
 C_1 &= x1 : 0.4 \vee x2 : 0.6. \\
 C_2 &= x2 : 0.1 \vee x3 : 0.9. \\
 C_3 &= x4 : 0.6 \vee x5 : 0.4 \leftarrow x1. \\
 C_4 &= x5 : 0.4 \leftarrow x2, x3. \\
 C_5 &= x6 : 0.3 \vee x7 : 0.2 \leftarrow x2, x5.
 \end{aligned}$$

CH_1, CH_2	$x1, x2$	$x1, x3$	$x2, x2$	$x2, x3$
$x2 = 1$	1.0	0.0	1.0	1.0
$x2 = 0$	0.0	1.0	0.0	0.0

$x2, x5$	t,t	t,f	f,t	f,f
$CH_5 = x6$	0.3	0.0	0.0	0.0
$CH_5 = x7$	0.2	0.0	0.0	0.0
$CH_5 = null$	0.5	1.0	1.0	1.0

Function Symbols

- What if function symbols are present?
- Infinite, countable Herbrand universe
- Infinite, countable Herbrand base
- Infinite, countable grounding of the program T
- Uncountable W_T
- Each world infinite, countable
- $P(w) = 0$
- Semantics not well-defined

Game of dice

```

on(0,1):1/3 ; on(0,2):1/3 ; on(0,3):1/3.
on(T,1):1/3 ; on(T,2):1/3 ; on(T,3):1/3 :-
    T1 is T-1, T1>=0, on(T1,F), \+ on(T1,3).
  
```

Hidden Markov Models

```

hmm(S, O) :-hmm(q1, [], S, O) .
hmm(end, S, S, []) .
hmm(Q, S0, S, [L|O]) :-
    Q\= end,
    next_state(Q, Q1, S0) ,
    letter(Q, L, S0) ,
    hmm(Q1, [Q|S0], S, O) .
next_state(q1, q1, _S) :1/3;next_state(q1, q2, _S) :1/3;
next_state(q1, end, _S) :1/3.
next_state(q2, q1, _S) :1/3;next_state(q2, q2, _S) :1/3;
next_state(q2, end, _S) :1/3.
letter(q1, a, _S) :0.25;letter(q1, c, _S) :0.25;
letter(q1, g, _S) :0.25;letter(q1, t, _S) :0.25.
letter(q2, a, _S) :0.25;letter(q2, c, _S) :0.25;
letter(q2, g, _S) :0.25;letter(q2, t, _S) :0.25.

```

Distribution Semantics with Function Symbols

- Semantics proposed for ICL and PRISM, applicable also to the other languages
- Definition of a probability measure μ over W_T
- μ assign a probability to every element of an algebra Ω of subsets of W_T , i.e. a set of subsets closed under union and complementation
- The algebra Ω is the set of sets of worlds identified by a finite set of finite composite choices

Knowledge-Based Model Construction

- The probabilistic logic theory is used directly as a template for generating an underlying complex graphical model [Breese et al., 1994].
- Languages: CLP(BN), Markov Logic

CLP(BN)

- Variables in a CLP(BN) program can be random
- Their values, parents and CPTs are defined with the program
- To answer a query with uninstantiated random variables, CLP(BN) builds a BN and performs inference
- The answer will be a probability distribution for the variables
- Probabilistic dependencies expressed by means of CLP constraints

```
{ Var = Function with p(Values, Dist) }  
{ Var = Function with p(Values, Dist, Parents) }
```

CLP(BN)

```

.....
course_difficulty(Key, Dif) :-
{ Dif = difficulty(Key) with p([h,m,l],
[0.25, 0.50, 0.25]) }.
student_intelligence(Key, Int) :-
{ Int = intelligence(Key) with p([h, m, l],
[0.5,0.4,0.1]) }.
.....
registration(r0,c16,s0).
registration(r1,c10,s0).
registration(r2,c57,s0).
registration(r3,c22,s1).

```

CLP(BN)

```

.....
registration_grade(Key, Grade):-
registration(Key, CKey, SKey),
course_difficulty(CKey, Dif),
student_intelligence(SKey, Int),
{ Grade = grade(Key) with
  p([a,b,c,d],
%h h  h m  h l  m h  m m  m l  l h  l m  l l
[0.20,0.70,0.85,0.10,0.20,0.50,0.01,0.05,0.10,
  0.60,0.25,0.12,0.30,0.60,0.35,0.04,0.15,0.40,
  0.15,0.04,0.02,0.40,0.15,0.12,0.50,0.60,0.40,
  0.05,0.01,0.01,0.20,0.05,0.03,0.45,0.20,0.10 ],
  [Int,Dif]))
}.
.....

```

CLP(BN)

```

?- [school_32].
   ?- registration_grade(r0,G) .
p(G=a)=0.4115,
p(G=b)=0.356,
p(G=c)=0.16575,
p(G=d)=0.06675 ?
?- registration_grade(r0,G),
   student_intelligence(s0,h) .
p(G=a)=0.6125,
p(G=b)=0.305,
p(G=c)=0.0625,
p(G=d)=0.02 ?

```

Markov Networks

- Undirected graphical models

- Each clique in the graph is associated with a **potential** ϕ_i

$$P(\mathbf{x}) = \frac{\prod_i \phi_i(\mathbf{x}_i)}{Z}$$

$$Z = \sum_{\mathbf{x}} \prod_i \phi_i(\mathbf{x}_i)$$

Intelligent	GoodMarks	$\phi_i(V, T)$
false	false	4.5
false	true	4.5
true	false	2.7
true	true	4.5

Markov Networks

- If all the potential are strictly positive, we can use a log-linear model

$$P(\mathbf{x}) = \frac{\exp(\sum_i w_i f_i(\mathbf{x}_i))}{Z}$$

$$Z = \sum_{\mathbf{x}} \exp(\sum_i w_i f_i(\mathbf{x}_i))$$

$$f_i(\text{Intelligent}, \text{GoodMarks}) = \begin{cases} 1 & \text{if } \neg \text{Intelligent} \vee \text{GoodMarks} \\ 0 & \text{otherwise} \end{cases}$$

$$w_i = 1.5$$

Markov Logic

- A Markov Logic Network (MLN) is a set of pairs (F, w) where F is a formula in first-order logic w is a real number
- Together with a set of constants, it defines a Markov network with
 - One node for each grounding of each predicate in the MLN
 - One feature for each grounding of each formula F in the MLN, with the corresponding weight w

Markov Logic Example

1.5 $\forall x \text{ Intelligent}(x) \rightarrow \text{GoodMarks}(x)$

1.1 $\forall x, y \text{ Friends}(x, y) \rightarrow (\text{Intelligent}(x) \leftrightarrow \text{Intelligent}(y))$

- Constants Anna (A) and Bob (B)

Markov Networks

- Probability of an interpretation \mathbf{x}

$$P(\mathbf{x}) = \frac{\exp(\sum_i w_i n_i(\mathbf{x}_i))}{Z}$$

- $n_i(\mathbf{x}_i)$ = number of true groundings of formula F_i in \mathbf{x}
- Typed variables and constants greatly reduce size of ground Markov net
