Prova scritta di EMQ - 17 Luglio 2019

Esercizio 1

Si considerino due osservabili (ρ e σ) in uno spazio di Hilbert di dimensione 3, rappresentate, nella base ortonormale $|1>, |2>, |3>$, rispettivamente dalle matrici

$$\begin{pmatrix} a & b & 0 \\ b & a & 0 \\ 0 & 0 & c \end{pmatrix}$$

e

$$\begin{pmatrix} s_1 & 0 & 0 \\ 0 & s_1 & 0 \\ 0 & 0 & s_3 \end{pmatrix}$$

con a e b reali e con $s_1 \neq s_3$,

1. Si verifichi che le due osservabili sono compatibili;
2. si calcolino i corrispondenti autovalori;
3. si costruisca una base ortonormale in cui entrambe le osservabili sono contemporaneamente diagonali.

Esercizio 2

Una particella di massa m in una dimensione è soggetta ad un potenziale a gradino $V(x)$: $V(x) = 0$, per $x \leq 0$, $V(x) = V_0$ per $x > 0$ (V_0 positivo); la particella è in un autostato di energia $E > 0$, con $E > V_0$.

1. Si scriva e si risolva l' equazione di Schrödinger su tutto l' asse delle x, supponendo che sia, per $x < 0$, $\psi_E(x) = e^{ikx} + A\ e^{-ikx}$, e, per $x > 0$, $\psi_E(x) = B\ e^{iqx}$ con opportuni valori (da calcolare) di k, q, A e B;
2. si calcoli $|A|^2$ e $|B|^2$ e si faccia un grafico di queste due quantità in funzione di $\epsilon = V_0/E$ nell' intervallo $0 < \epsilon < 1$.

Esercizio 3

Si consideri un sistema di due particelle preparato nello stato $|l_1, m_1 > |l_2, m_2 > \ = |1, 0 > |1, 0 >$ ($|l_i, m_i >$ indicano gli autostati di corrispondente autovalore del momento angolare e della sua proiezione sull' asse z per le singole particelle). Si misura su tale stato il valore del momento angolare totale $J = L_1 + L_2$ e la corrispondente componente lungo l' asse z, $J_z = l_{1z} + l_{2z}$.

1. Si calcoli quali valori di J_z si possono ottenere a seguito della misura e con quale probabilità;
2. si calcoli quali valori di J si possono ottenere e con quale probabilità.

42. CLEBSCH-GORDAN COEFFICIENTS, SPHERICAL HARMONICS, AND d FUNCTIONS

Note: A square-root sign is to be understood over *every* coefficient, *e.g.*, for $-8/15$ read $-\sqrt{8/15}$.
