Prova scritta di EMQ - 11 Settembre 2019

Esercizio 1

Si consideri un oscillatore armonico descritto dall' hamiltoniana

$$H = \frac{p^2}{2m} + \frac{1}{2} m\omega^2 x^2 \quad . \tag{1}$$

Inizialmente il sistema si trova nello stato fondamentale.

1. Si scriva la funzione d'onda normalizzata del sistema;
2. al tempo t_0 il valore di ω cambia in $\omega' = \omega/2$ e si esegue immediatamente una misura dell' energia. Si calcoli la probabilità che la misura ottenuta sia quella corrispondente allo stato fondamentale della hamiltoniana relativa al nuovo valore della pulsazione.

Suggerimento: si ricorda che $\int e^{-ax^2} dx = \sqrt{\pi/a}$.

Esercizio 2

Si consideri una particella di massa m in una dimensione soggetta a un potenziale $V(x) = \lambda x^4$. Si vuole cercare una soluzione della equazione di Schrödinger del tipo $\psi(x) = e^{-\alpha|x|^n}$, valida nel limite di $|x| \to \infty$. A questo scopo:

1. si scriva l' equazione di Schrödinger per la particella;
2. si sostituisca nell' equazione la funzione d'onda sopra suggerita, tenendo solo le potenze di x con il massimo esponente;
3. si determini, sulla base della risposta al punto precedente, il valore di n;
4. si determini infine il valore di α;

Esercizio 3

Si consideri un sistema di due particelle preparato nello stato $|l_1, m_1 > |l_2, m_2 > \; = \; |1, 1 > |1, -1 >$ ($|l_i, m_i >$ indicano gli autostati di corrispondente autovalore del momento angolare e della sua proiezione sull' asse z per le singole particelle). Si misura su tale stato il valore del momento angolare totale $J = L_1 + L_2$ e la corrispondente componente lungo l' asse z, $J_z = l_{1z} + l_{2z}$.

1. Si calcoli quali valori di J_z si possono ottenere a seguito della misura e con quale probabilità;
2. si calcoli quali valori di J si possono ottenere e con quale probabilità.

42. CLEBSCH-GORDAN COEFFICIENTS, SPHERICAL HARMONICS, AND d FUNCTIONS

Note: A square-root sign is to be understood over *every* coefficient, *e.g.*, for $-8/15$ read $-\sqrt{8/15}$.
